

OPTIMAL EXECUTION CME GROUP

IE597 PRACTICUM PROJECT #5 - SPRING 2023

INTRODUCTION

TEAM MEMBERS

HARIHARAN MANICKAM

PRABHULING MASOODI

ANANYA SINGH

LIANG ZHANG

SPONSORS - CME GROUP

- **Mr.INDERDEEP SINGH:** Executive Director for Architecture and Product Management
- **Mr. MOHANDAS AYIKARA:** Director Data Science
- **Mr. GEORGE DEAMONT:** Manager of Data Science
- **Mr. PIYUSH KALKUTE:** Senior Data Scientist

MOTIVATION

- Optimal Execution of a large order
- Manage
 - I. Volume
 - II. Slippage
 - III. Price Impact
- Participation rate is a key constraint
- Strengthen understanding of market dynamics

OVERVIEW

Problem Statement

- **Liquidate** a *large order** in a **2-hour** time window at the **Best** price.
- Dataset - **10-year bond (ZN) futures** 2 months of **nanosecond-second** High Frequency orderbook data for **20** levels(bid and ask)

Solution

- **Machine Learning model** - predicts next second price change.
 - Parameters of the model: Net-buy, Multilevel Order Flow Imbalance (MLOFI), Mean Reversion Lag
 - Output: Change in mid-price (ΔP)
- **Algorithm** - uses the model to decide the trade at that second
 - Direct constraint - *Participation rate**; Indirect constraints - *Replenishment rate*
- **Test Harness**
 - Simulates a **reactionless market** for the algorithm to trade
 - Gradually **replenishes** orders the algorithm makes

*A **large order** is defined as an order that is typically 10 to 20 times the size of the average volume on the top of the book.

*A **participation rate** is used to restrict the strategy from liquidating everything right away in a reactionless market, often set between 5%~20%
